

Hyperscale greenfield campus

Taxonomy group 1 of 8 · 2 sites · hyperscale_greenfield_campus

Visual definition

A cluster of several very large (>150 m long) rectangular halls laid out in parallel rows on a single fenced campus carved out of agricultural/exurban land. Footprint dwarfs everything around it; the campus reads as an isolated industrial island in farmland, frequently still mid-build with bare graded earth between halls.

Common overhead features

- multiple parallel data halls (phased), uniform bright roofs
- very large dedicated on-site substation + incoming transmission line corridor
- wide security setback, perimeter fence, and ring road around the campus
- large stormwater retention basins (often several, geometric)
- graded/bare earth laydown and staging areas during construction
- modest car parking relative to building area (lightly staffed)

Distinguishable from lookalikes by

Sheer scale + a dedicated high-voltage substation and transmission spur set it apart from distribution warehouses, which have many truck docks/trailer courts and no substation. The parallel repeated-hall geometry and isolation in farmland are decisive.

Findability

Sentinel-2 (~10 m): high — The footprint spans many 10 m pixels and contrasts sharply with surrounding fields; bright roofs + graded earth are obvious. Strong year-over-year change signature as halls appear/expand (e.g. Meta DeKalb 2024->2025). Watch seasonal color (2024 mosaic is autumn, 2025 summer) — confirm change with structure, not just hue.

NAIP / high-res: very_high — Every feature (halls, substation, transformers, basins) is unambiguous in high-res. Source recency is the catch: USGS NAIP is 2019 and USDA-prime NAIP is 2021 in Illinois, both of which predate the newest campuses (bare field at Meta DeKalb). Esri World Imagery fills the gap — 2024 captures show the DeKalb halls, substation, and ponds in full. Pick the most recent source per site and treat older NAIP as 'before' imagery.

Recommended CV labels

data_hall, hyperscale_campus, substation, transmission_line, stormwater_pond, perimeter_fence, ring_road, construction_laydown

Large purpose-built wholesale / colocation data center

Taxonomy group 2 of 8 · 6 sites · `large_purpose_built_data_center`

Visual definition

One, or a few connected, very large light-grey/white rectangular buildings that are obviously engineered as a data center (not a generic shed): blank windowless walls, repeated data-hall modules, and a roof carpeted with mechanical equipment. Stands on its own secured parcel in an industrial park or suburban campus.

Common overhead features

- dense, regular grid of rooftop units (chillers / CRAH / dry coolers / condensers)
- fenced ground equipment yard: generator line-up + bulk fuel/diesel tanks
- on-site transformer/switchgear yard fed from the grid
- repeated structural bays/hall modules giving a ribbed or segmented roof
- security fence with a single controlled vehicle entrance; guard/gate
- employee + visitor parking, loading area, minimal glazing

Distinguishable from lookalikes by

The combination of a generator/fuel yard + transformer yard + dense rooftop cooling is the signature; plain warehouses have loading-dock trailer courts and bare roofs instead. The rooftop-equipment density per unit roof area is far higher than any logistics building.

Findability

Sentinel-2 (~10 m): moderate — The large bright roof is detectable and its size narrows candidates, but at 10 m it is not separable from a similarly large warehouse/factory. Useful as a size prior only; the mechanical detail that confirms it is sub-pixel.

NAIP / high-res: very_high — At ~0.3-1 m the rooftop cooling grid, generator/fuel yard, and transformer yard are all directly visible and highly diagnostic. This is the easiest class to confirm in high-res, when NAIP is current enough to include the build.

Recommended CV labels

`data_hall`, `rooftop_chiller_array`, `generator_yard`, `fuel_tank`, `transformer_yard`, `substation`, `security_fence`, `parking_lot`

Industrial-park, warehouse-style colo

Taxonomy group 3 of 8 · 19 sites · `industrial_park_warehouse_style_colo`

Visual definition

A medium-to-large flat rectangular building that, at a glance, is indistinguishable from the logistics warehouses surrounding it in the same business park. Only secondary cues — rooftop cooling, a generator enclosure, and the near-absence of truck docks — reveal it as a data center.

Common overhead features

- plain flat roof with clustered rooftop units / a screened rooftop cooling area
- a small fenced generator/fuel enclosure on one side
- few or no dock-high doors and little/no trailer parking (vs a real warehouse)
- blank facade, modest car park, embedded in a grid of near-identical buildings
- occasional ground chiller/cooling yard tucked against the building

Distinguishable from lookalikes by

Hardest class. Look for the absence of loading docks/trailers (data centers move bits, not pallets) combined with the presence of standby generators and denser-than-warehouse rooftop mechanical. A warehouse has many docks and a bare roof; this has neither.

Findability

Sentinel-2 (~10 m): low — Effectively a warehouse at 10 m — same size, shape, and roof brightness as its neighbors. Sentinel-2 cannot separate it from the surrounding logistics stock; expect very low precision. Use only to flag 'large flat roof in an industrial park'.

NAIP / high-res: moderate — Confirmable in high-res but requires reading the subtle cues (generator yard, dock absence, rooftop unit density). High false-positive rate against neighboring warehouses; human or fine-grained model verification recommended.

Recommended CV labels

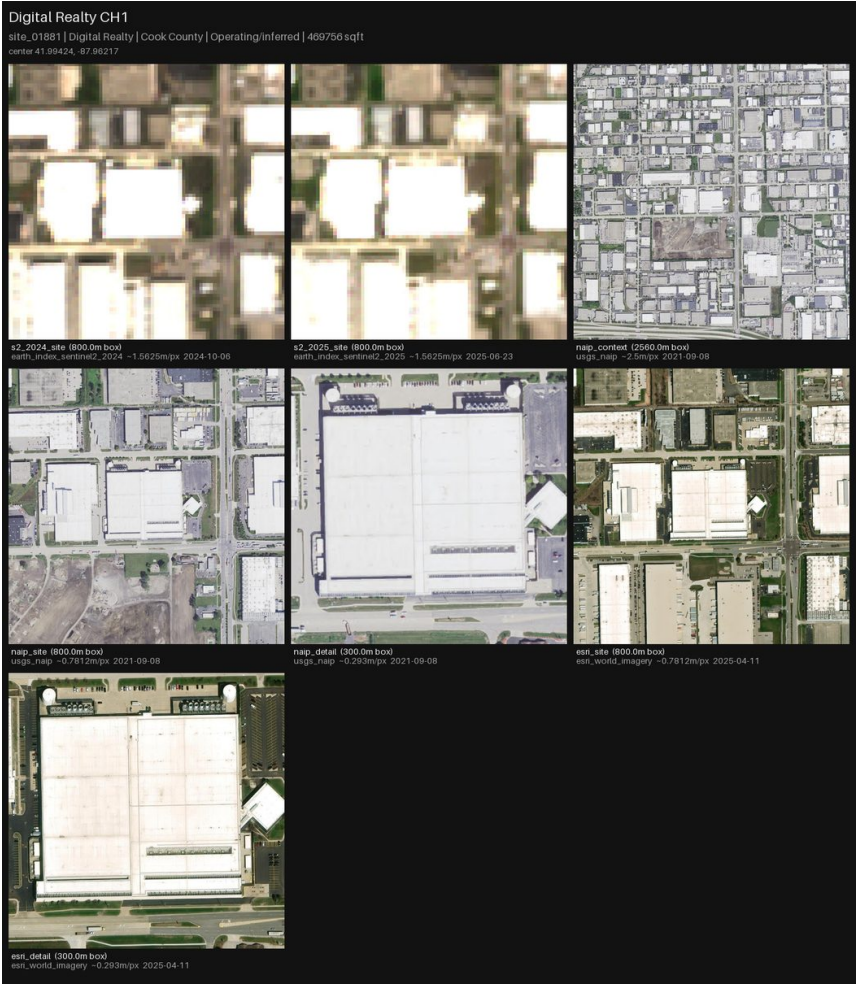

`warehouse_style_datacenter`, `rooftop_unit_cluster`, `generator_yard`, `no_loading_dock`, `industrial_park`, `screened_cooling_yard`

Urban carrier hotel / multi-tenant interconnection

Taxonomy group 4 of 8 · 7 sites · `urban_carrier_hotel_multitenant`

Visual definition

A multistory masonry/concrete building wedged into the dense downtown grid, flush to the street with no setback or parking lot — typically a converted printing, telecom, or industrial building. The only overhead tell is a heavy mechanical/cooling plant on the roof.

Common overhead features

- rooftop cooling-tower bank / chiller plant / mechanical penthouse
- zero setback: footprint fills the parcel within the city block grid
- no dedicated surface parking; loading via street or small dock
- multistory (casts a tall shadow), large flat roof relative to neighbors
- occasional rooftop fuel tanks / louvered generator-exhaust structures

Distinguishable from lookalikes by

Indistinguishable from any large downtown commercial/office building except for the dense rooftop cooling plant and the unusually blank, windowless upper floors. The rooftop cooling-tower array is the single most diagnostic feature.

Findability

Sentinel-2 (~10 m): `very_low` — Just one more roof in a downtown full of large roofs at 10 m. No usable signal; Sentinel-2 should not be expected to find these.

NAIP / high-res: `low` — Possible in high-res only by spotting the rooftop cooling-tower/chiller plant; otherwise it reads as a generic urban building. Shadows help confirm height. Expect many misses.

Recommended CV labels

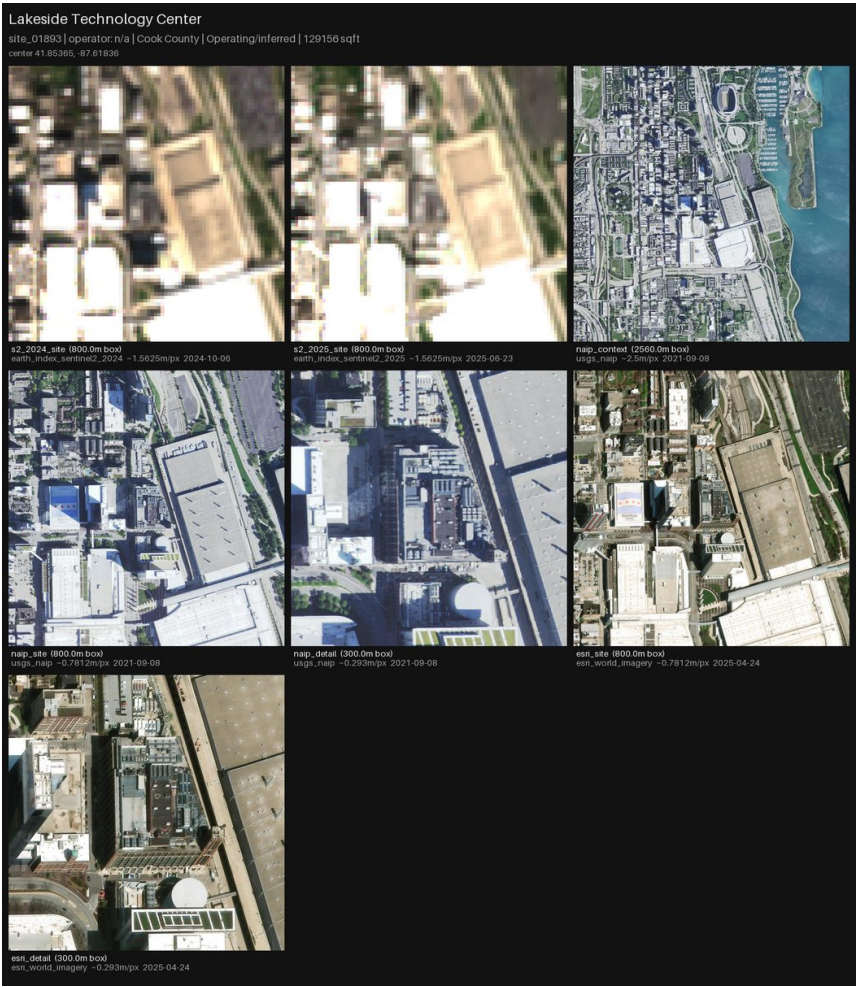

`carrier_hotel`, `rooftop_cooling_tower`, `mechanical_penthouse`, `urban_multistory`, `zero_setback_building`

Enterprise / corporate-campus data center

Taxonomy group 5 of 8 · 1 sites · enterprise_corporate_campus

Visual definition

A data center embedded in a company's own office campus: an architectural, often glazed and landscaped building whose data hall is a windowless attached wing. Looks like a corporate HQ, not an industrial box, surrounded by generous employee parking and landscaping.

Common overhead features

- windowless, blank-walled wing attached to a conventional office building
- ground-level chiller/generator enclosure beside the data wing
- landscaped corporate campus with large employee parking fields
- rooftop units concentrated over the data wing only
- single corporate entrance road, manicured setbacks/retention pond

Distinguishable from lookalikes by

The data hall hides inside an office aesthetic; distinguish from a pure office park by the windowless wing plus dedicated generators/chillers that an ordinary office would not have.

Findability

Sentinel-2 (~10 m): `very_low` — Reads as a suburban office park at 10 m; no separable data-center signal.

NAIP / high-res: `low` — Confirmable only by the windowless data wing + adjacent generator/chiller yard against an otherwise office-like campus. Easy to miss; many office parks look similar.

Recommended CV labels

`enterprise_datacenter`, `windowless_wing`, `office_campus`, `generator_yard`, `chiller_yard`

Institutional / research HPC facility

Taxonomy group 6 of 8 · 2 sites · `institutional_research_hpc`

Visual definition

A purpose-built supercomputing/HPC building on a university or national-laboratory campus: a modest-to-medium footprint carrying a disproportionately large cooling plant, set among research buildings and campus roads rather than warehouses.

Common overhead features

- outsized cooling plant (cooling towers / chiller yard) relative to building size
- distinctive engineered roofline (segmented/curved), often a recent build
- campus context: research buildings, ring roads, ag/open land at the edge
- ground transformer/switchgear yard; standby generators
- campus parking, not industrial-park layout

Distinguishable from lookalikes by

The cooling-to-building ratio is the giveaway — far more cooling than a normal campus building — combined with siting inside a research/university campus rather than an industrial park.

Findability

Sentinel-2 (~10 m): `low` — The cooling yard may hint at it for larger facilities (e.g. NCSA), but the building itself is small at 10 m and blends into campus structures. Low, not zero.

NAIP / high-res: `moderate` — The prominent cooling plant and engineered roof are visible and fairly diagnostic in high-res; campus context aids interpretation.

Recommended CV labels

`hpc_facility`, `cooling_tower`, `chiller_yard`, `research_campus`, `transformer_yard`

Small retrofit / edge site / point-of-presence

Taxonomy group 7 of 8 · 4 sites · `small_retrofit_edge_or_pop`

Visual definition

A small single building — a suburban flex/office retrofit, a telecom central office, or an edge PoP — with little or no externally visible data-center signature. Some entries are geocoded registry points that land on ambiguous small commercial buildings.

Common overhead features

- small footprint (often <40k sqft) single building
- a few rooftop units and maybe one external generator pad — or nothing visible
- ordinary parking; sometimes a small stormwater pond (suburban retrofit)
- no campus, no substation, no repeated halls
- may be a flush urban/telecom building or a generic suburban office

Distinguishable from lookalikes by

Usually NOT separable from ordinary small commercial/office/telecom buildings from overhead. Treat as low confidence; confirm from the registry/known-location dataset rather than from imagery alone.

Findability

Sentinel-2 (~10 m): `very_low` — Below any useful Sentinel-2 signal; not findable.

NAIP / high-res: `very_low` — Even in high-res these look like generic small buildings; some are pure registry-point artifacts (e.g. a 204-sqft 'site'). High-res confirms the building exists but rarely that it is a data center.

Recommended CV labels

`small_datacenter`, `telecom_central_office`, `edge_pop`, `generator_pad`, `low_confidence_site`
